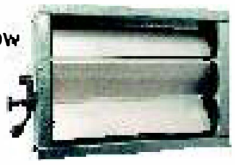
Dampers of **DA** series are mounted in air ducts of either rectangular or circular cross-section to control volumetric flow rate in branches of air conditioning ductworks.

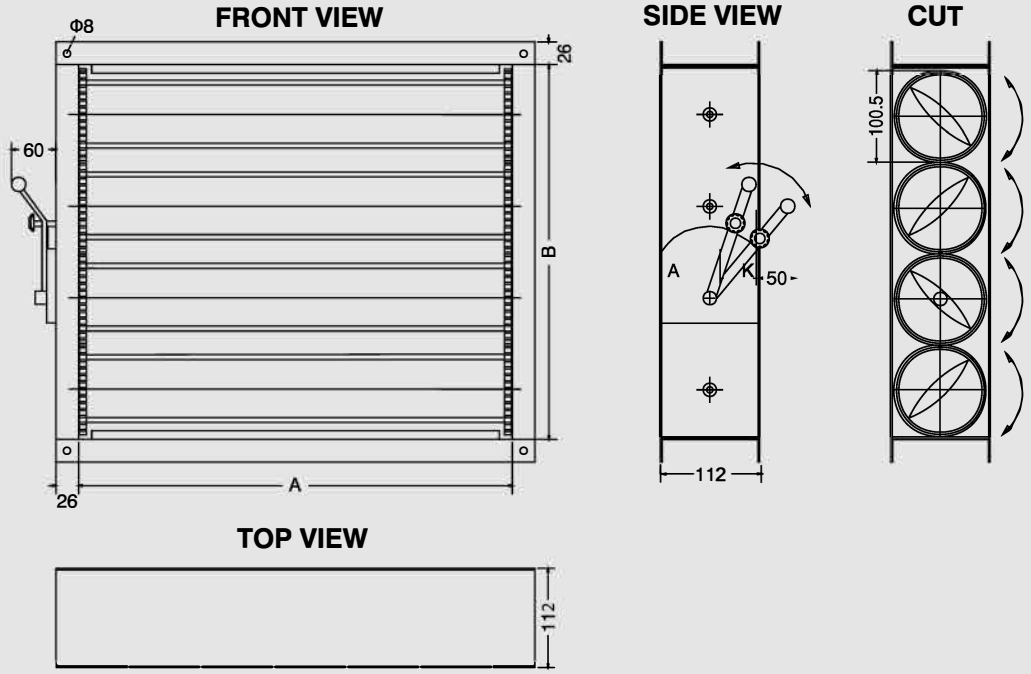


Technical description - General

DA series dampers can be manufactured at any size. Galvanized iron plates of 1.5 mm thick and aluminum is used in their construction providing long life. Their blades have aerodynamic shape, reducing resistance and swirl of the passing air. Plastic gears located at the two sides of the blades move the blades. High accuracy in their construction guarantees steady and reliable operation, without vibrations. The DA series dampers may be driven using electric servomotor, requiring no further modifications. Their technical characteristics are : Flow rate : ... [m^3/h], Pressure drop : ... [Pa], Noise level : ... [dBA].
DA series dampers are used in cases where manual or automatic (electric) regulation of volumetric flow rate is required, usually in ventilation air ducts or air conditioning installations. For example they can be mounted on ducts in order to balance airflow, or they can work in combination with analog sensors for volumetric flow rate for ventilated air regulation. More than one damper combinations may be used in order to keep steady volumetric flow rate in an air conditioning system.
The figure below shows the DA series dampers dimensions. Their nominal width A- and height B- are necessary to define their operating data.

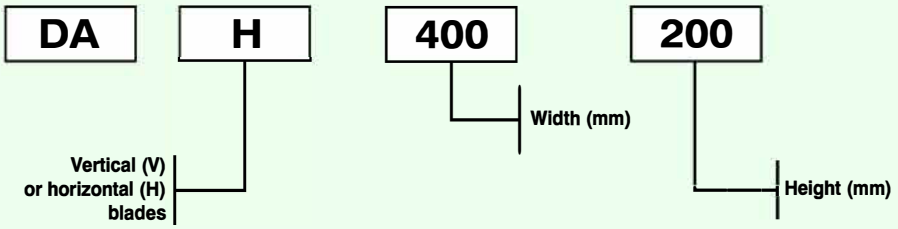
Selection of DA dampers

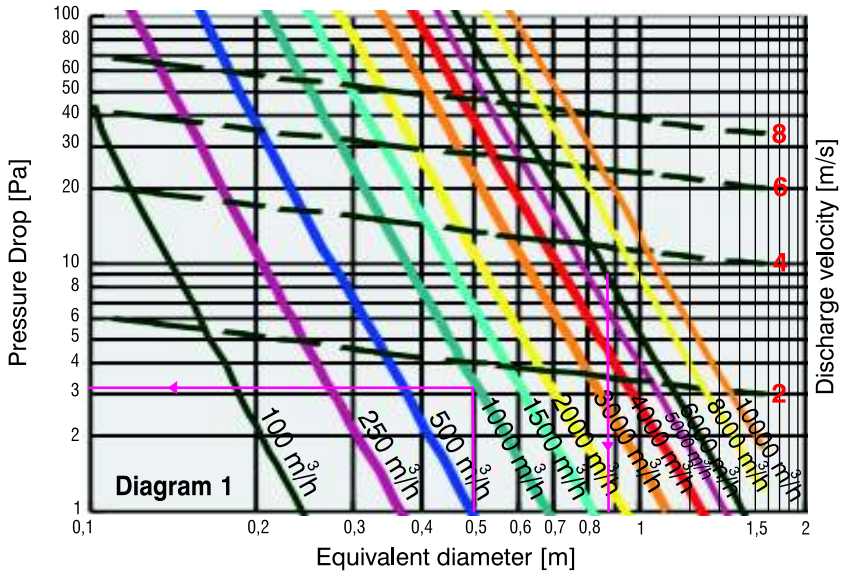
The selection parameters of DA series dampers are pressure drop, air velocity at the damper and noise level. **The following diagrams show operating data of dampers at full open position. To calculate the damper characteristics at different opening angles one may use the data from Table 1.**

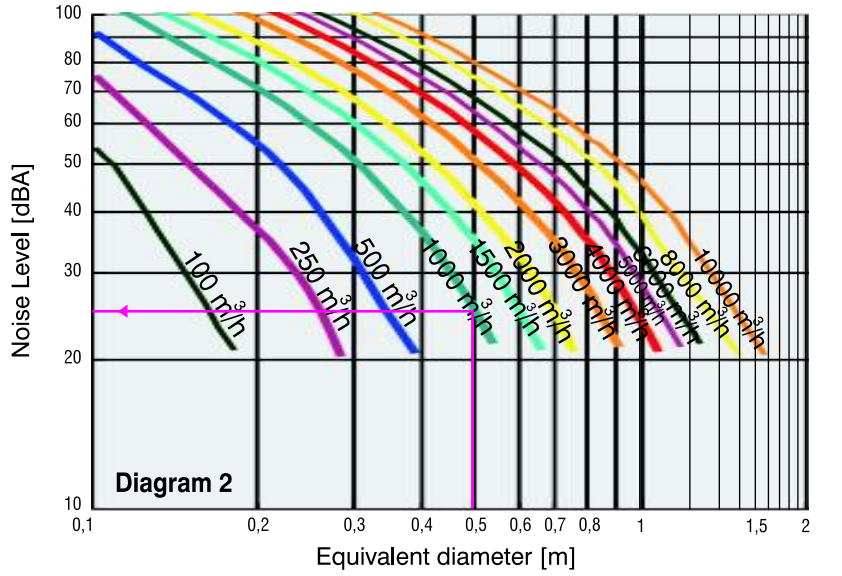


ORDER GUIDELINES

A series of numbers and letters is used to order DA series dampers. Their characteristics are defined according to the code below. The order example corresponds to a DA series damper of nominal dimensions 400X200 mm, of 400mm horizontal blades and servomotor placed on the 200mm dimension.







Selection example

What is the pressure requirement for a DA series damper of nominal dimensions 50X40 cm, used for a flow rate of 1000m³/h fresh air? What is the resulting noise level?

The equivalent diameter of the 50x40 cm DA series damper is found from the equivalent diameter selection table to be 50 cm. According to diagram 1, for 1000m³/h the pressure drop is 3,1 Pa or approximately 0,31 mmWG (mm of water gauge). This volumetric flow rate corresponds to a mean air velocity of about 1,5 m/s at the damper. The resulting noise may be found from diagram 2 to be around 24 dBA.

What are the necessary dimensions of a DA series damper in a ventilating system, in order to cover a need of 5000 m³/h of fresh air?

Diagram 1 shows that for an airflow of 5000 m³/h the pressure requirement lies between 100 and 4 Pa, for equivalent diameters of 0,45 and 1 m, respectively.
By considering that a pressure drop of 10 Pa is adequate to cover the specific need, then, following diagram 1, the required equivalent diameter is 0,79 m. If due to constructional reasons the grille height is kept to 70 cm, then according to the table of equivalent diameter selection the damper's width is 70 cm. For an operating angle of 30° the required pressure drop is 10x3,8 = 38 Pa, according to Table 1. If the pressure drop remained the same (10 Pa), the air flow rate should have been reduced to 2500 m³/h.

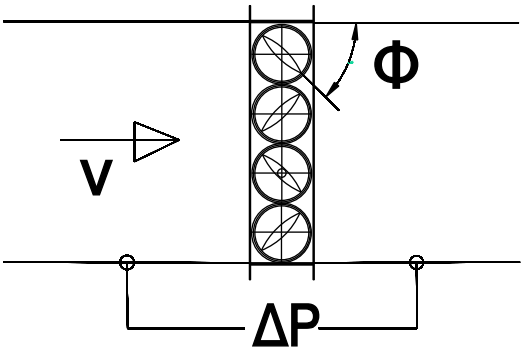


TABLE 1

Blade's inclination in (°) from horizontal	Reduction of free area	Mean excess ratio of pressure drop	Volumetric flow rate reduction for the same pressure drop	Mean noise increase for the same flowrate
30°	50%	x 3,8	49%	+7,8 dBA
45°	70%	x 8,7	66%	+15,9 dBA
60°	86%	x 15,8	75%	+24,6 dBA
